

A Water Resource Strategy for the South East of England

Addendum Note to Table 4.1, Page 27

Since publishing this report we have been advised by Thames Water that their actual leakage to 31st March 2007 was 790Ml/d, and that their average since April is nearer 690Ml/d

We are pleased to be able to report these improvements on the 915 Ml/d published in table 4.1, and to acknowledge Thames Water's effort to improve leakage. But it is also clear from these latest figures that the Thames Water leakages remain unacceptably high.

This addendum note is part of the dialogue and attention this report is intended to stimulate. We invite further comments from other members of the water industry and we will be happy to acknowledge and include further actions that we are advised of.
